WEB DEVELOPMENT PROJECT REPORT

A Beginner-Level HTML and CSS Project

PROJECT WEBSITES

1. BVT Bites — Food Ordering Website
2. Tourist Places — Travel Website
3. BVT Shopping Store — Shopping Website

Student Name	Talla Venkata Tej Kiran
Roll Number	26001118
Section	CSM 4
Submitted to	Venkat Lakshmi Madam
Academic Year	2026–2027

Department of Computer Science and Engineering (AI & ML)

CERTIFICATE

This is to certify that the project report entitled “Web Development Project Report” submitted by Talla Venkata Tej Kiran (Roll Number: 26001118), Section CSM 4, during the academic year 2026–2027, is a record of the beginner-level HTML and CSS website work presented for the college assignment, under the guidance of Venkat Lakshmi Madam.

The report describes three static website designs: BVT Bites (Food Ordering Website), Tourist Places (Travel Website), and BVT Shopping Store (Shopping Website).

Date: _____ Place: _____

ACKNOWLEDGEMENT

I would like to express my sincere thanks to Venkat Lakshmi Madam for her guidance and support during this web development assignment. Her instructions helped me understand the basics of HTML and CSS and apply them to simple website layouts.

I am also thankful to my department and college for providing the opportunity to practise web development. Finally, I thank my family and friends for their encouragement while completing this project.

Talla Venkata Tej Kiran
Roll Number: 26001118
Section: CSM 4

INDEX / TABLE OF CONTENTS

Section	Page (approx.)
Certificate	2
Acknowledgement	3
1. Introduction to Web Development	5
2. Objectives of the Project	5
3. Technologies and Tools Used	6
4. Food Ordering Website — BVT Bites	7
5. Travel Website — Tourist Places	9
6. Shopping Website — BVT Shopping Store	11
7. Basic HTML and CSS Concepts Used	13
8. Testing and Results	14
9. Limitations	15
10. Conclusion	16

Note: Page numbers are approximate and may shift slightly if the report is edited.

1. Introduction to Web Development

Web development is the process of creating websites that people can open and use through a web browser. A website can contain headings, paragraphs, images, navigation links, cards, and other page elements.

HTML (HyperText Markup Language) provides the structure and content of a web page. CSS (Cascading Style Sheets) controls its appearance, including colours, spacing, alignment, borders, and layout.

This project contains three simple websites made with beginner-level HTML and CSS: BVT Bites, Tourist Places, and BVT Shopping Store. The project helped me practise how to organise page content and apply a consistent visual design.

2. Objectives of the Project

• To understand the basic structure of an HTML document.

• To practise styling web pages with CSS.

• To create three different website layouts for food, travel, and shopping.

• To use headings, paragraphs, images, navigation menus, sections, cards, and buttons.

• To learn how colours, spacing, and alignment affect readability.

• To test the pages in a web browser and observe their appearance.

3. Technologies and Tools Used

HTML: Used to create the page structure, headings, navigation items, text, image areas, product/place cards, and sections.

CSS: Used to style colours, backgrounds, text, spacing, alignment, borders, and card layouts.

Visual Studio Code: Used as the code editor for writing and editing the HTML and CSS files.

Web browser: Used to open the local HTML files and check how the websites appear. The screenshots show the pages opened locally in a browser.

Scope note: These websites are front-end demonstrations. JavaScript, databases, backend services, user accounts, and payment gateways were not used in the project.

4. Food Ordering Website — BVT Bites

Introduction: BVT Bites is a simple food ordering website concept. Its page introduces the brand and displays a menu of food items with short descriptions, prices, and Order Now buttons.

Features visible in the website:

• A header with the title “BVT Bites” and the tagline “Food for Supermans”.

• A navigation bar containing Home, Menu, About, and Contact.

• A welcome section with an Explore Menu button.

• Four food cards: Pizza, Burger, Cheese Pizza, and Grilled Special.

• Prices and short descriptions for the displayed food items.

• About Us and Contact Us sections, followed by a footer.

Design explanation: The page uses orange as its main highlight colour, dark grey for the navigation bar and footer, and light cream backgrounds for content sections. Food images are placed in cards, with the item name, description, price, and button arranged below each image. This makes the menu easy to scan.

Note: The visible Order Now buttons are part of the page design. The report does not claim that they complete an online order.

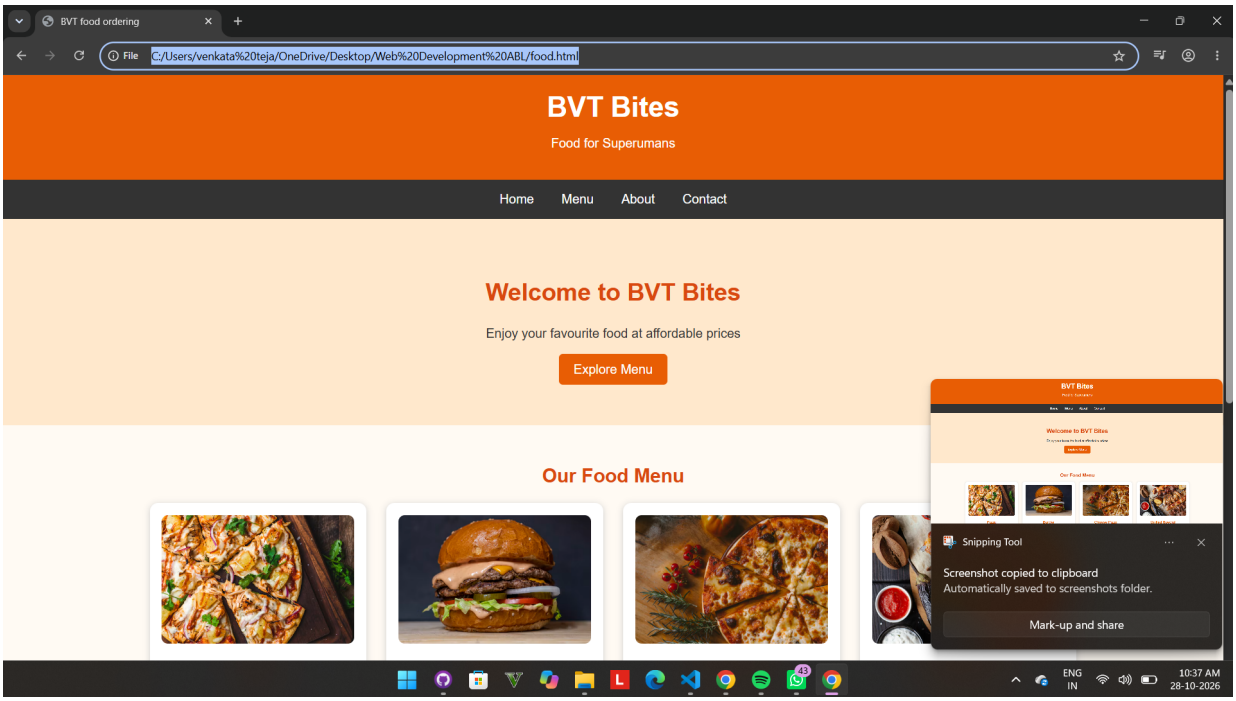

Figure 1. BVT Bites — welcome section and food menu.

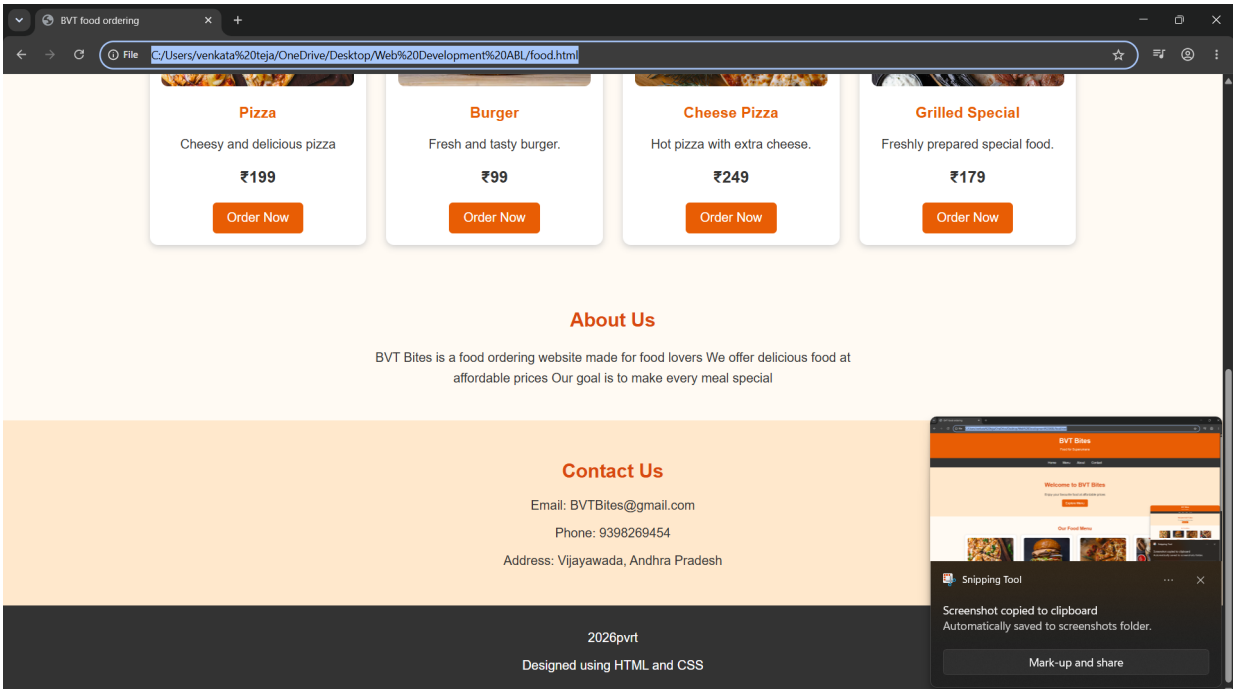

Figure 2. BVT Bites — menu cards, About Us, and Contact Us sections.

5. Travel Website — Tourist Places

Introduction: The Tourist Places website presents a few popular destinations in India. It gives visitors a simple visual introduction to each place, along with its location and an example price.

Features visible in the website:

• A header titled “Explore India” with the subtitle “Discover Beautiful Places in India”.

• A navigation bar containing Home, Places, About, and Contact.

• A welcome section introducing the travel website.

• Three destination cards: Taj Mahal, Goa, and Jaipur.

• A location and price shown for each destination.

• About Us and Contact Us sections, followed by a footer.

Design explanation: The website uses a blue title area, a black navigation bar, a light-blue welcome section, and a light background for the destination cards. Each card places a destination image above its name, location, and price. The layout keeps the three destinations side by side on the desktop screenshot.

Note: The listed prices are displayed as sample content. The website is a static front-end page and does not show a booking workflow.

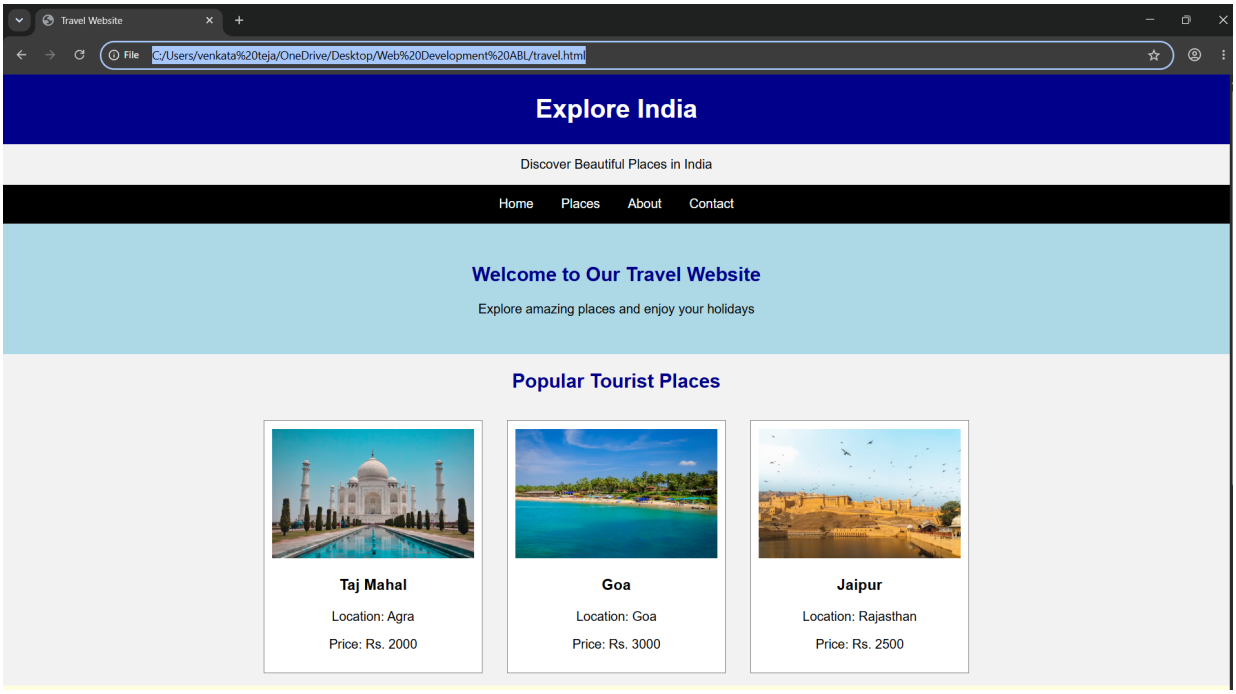

Figure 3. Tourist Places — header, welcome section, and destination cards.

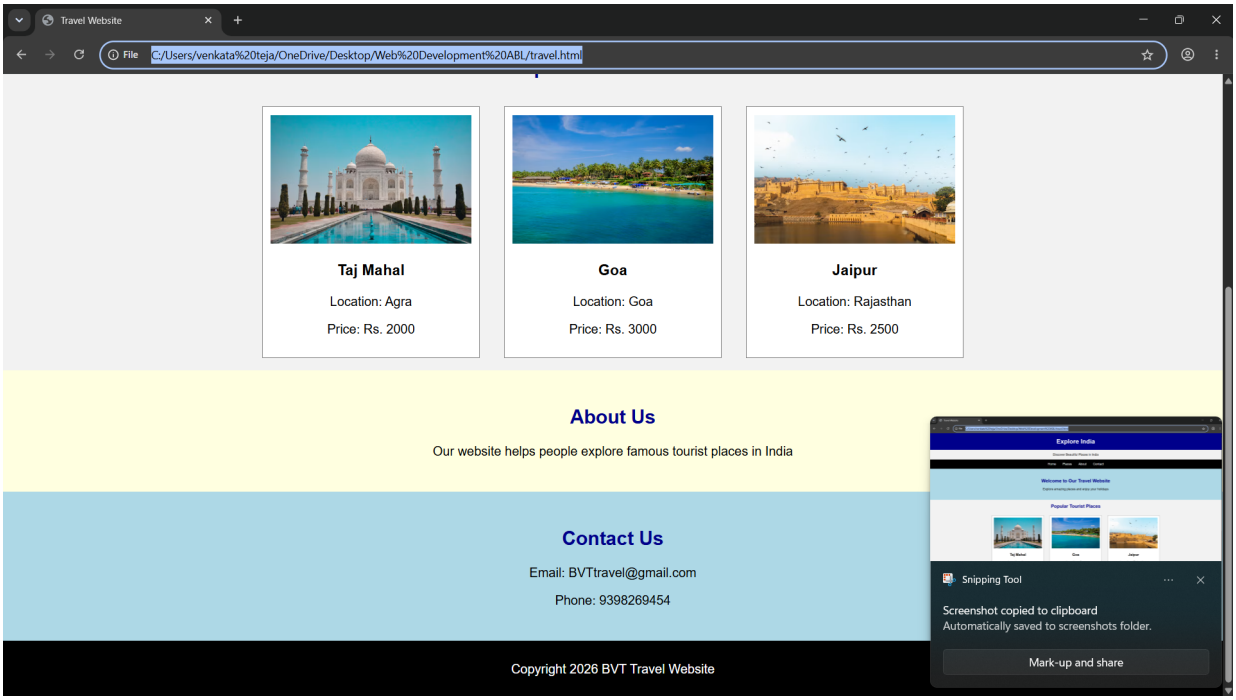

Figure 4. Tourist Places — destination cards, About Us, and Contact Us sections.

6. Shopping Website — BVT Shopping Store

Introduction: BVT Shopping Store is a simple shopping page that presents a small set of products with prices and Buy Now buttons.

Features visible in the website:

• A header titled “BVT Shopping Store” and the subtitle “Your Favourite Shopping page”.

• A navigation bar containing Home, Products, About, and Contact.

• A welcome section with a short shopping message.

• Four product cards: Wrist Watch, Sports Shoes, Camera, and Headphones.

• A price and Buy Now button on each product card.

• About Us and Contact Us sections, followed by a footer.

Design explanation: The page uses a black and gold/brown premium colour theme. Black is used for the main header, navigation bar, buttons, and footer, while gold/brown tones highlight headings and button text. Light cream backgrounds and bordered white product cards create contrast and keep product images clear.

Note: The Buy Now buttons are visual interface elements. No cart, payment gateway, or purchase-processing feature is claimed.

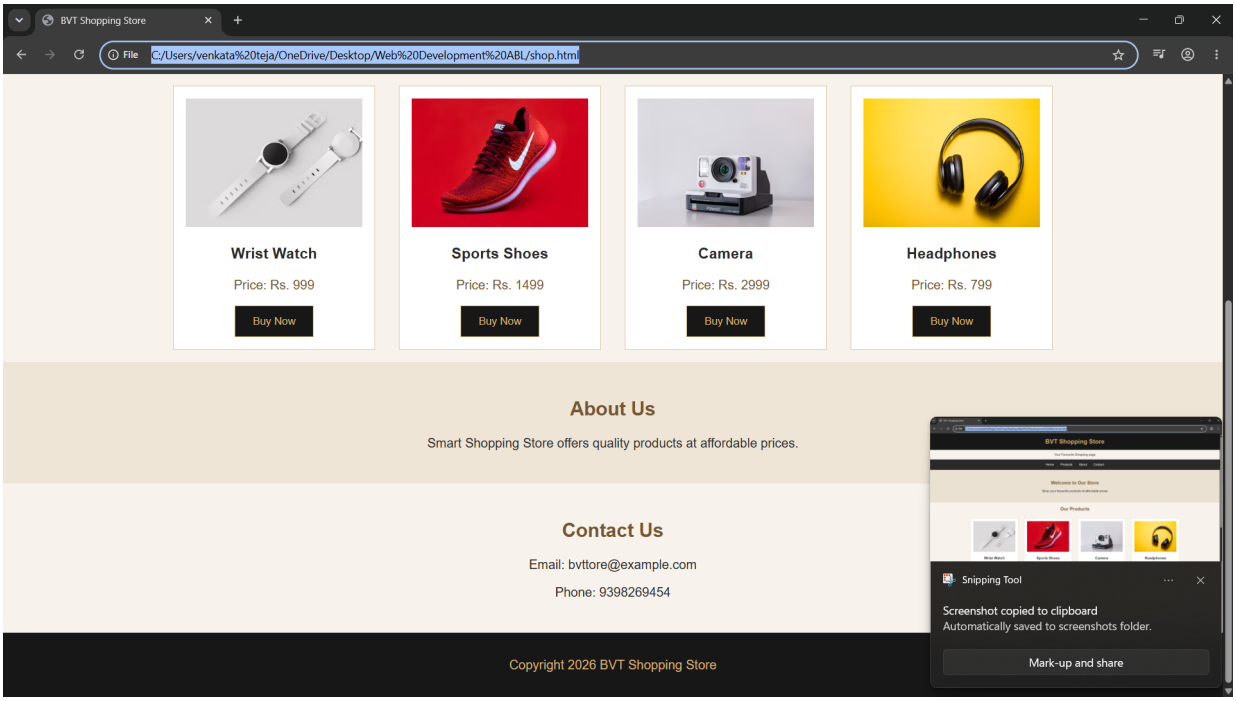

Figure 6. BVT Shopping Store — product cards, About Us, and Contact Us sections.

7. Basic HTML and CSS Concepts Used

HTML document structure: A web page is organised using elements such as headings, paragraphs, links, images, sections, and containers.

Headings and paragraphs: Headings identify page sections and item names; paragraphs display descriptions, locations, prices, and contact information.

Images: Images make food items, tourist places, and products easier to recognise.

Navigation: Navigation items are presented near the top of each page to show the main website sections.

CSS colours and backgrounds: Background and text colours help distinguish the header, navigation bar, content sections, cards, and footer.

Spacing and alignment: Margins, padding, and text alignment provide space between elements and help organise content.

Borders and cards: Borders and card-style containers separate individual food items, destinations, or products from one another.

Buttons: Buttons such as Explore Menu, Order Now, and Buy Now are styled to look interactive. Their presence alone does not mean a working action is implemented.

8. Testing and Results

The three HTML pages were opened in a desktop web browser and checked visually. The supplied screenshots show the top and lower sections of the pages.

Visual checks included:

• The page title and main sections were visible.

• Navigation labels and section headings were readable.

• Food, destination, and product images appeared inside their cards.

• Prices and descriptions were displayed with the relevant cards.

• About Us, Contact Us, and footer sections were present.

Result: The screenshots show that all three static website designs render in the browser. This testing was visual and manual; it does not establish that the buttons perform transactions or that the sites work with a backend.

9. Limitations

• The websites are static front-end pages created with HTML and CSS.

• Buttons are displayed visually, but functional ordering, booking, cart, or purchase actions are not demonstrated.

• There is no database to store products, destinations, orders, or customer information.

• There is no payment gateway, login system, or backend processing.

• The report screenshots show a desktop browser view; responsive behaviour on every screen size has not been verified.

• The sample prices and contact details are page content and should be verified before any real-world use.

10. Conclusion

This project gave me practical experience in building simple web pages with HTML and CSS. I created three different website designs for food ordering, travel destinations, and shopping. Each website uses headings,

navigation, images, content sections, cards, colours, and spacing to present information clearly.

Through this work, I learned that HTML provides the structure of a page while CSS controls its visual appearance. The project is a useful starting point for learning more advanced topics such as responsive design, JavaScript, forms, and backend development in future projects.
